

DOOR CLOSER REPLACEMENT

1. Attach mounting bracket to door approximately at center and flush with top edge using four mounting screws.
2. Push roller lever forward (at right angle to mounting bracket) so that it overlaps door.
3. Attach hook to the door frame, aligning it with a roller. Use two slots first, to permit following adjustments:
 - Rubber roller should touch and slightly revolve as it passes top lip of hook when door is closing.
 - The hook must be on the same centerline as mounting bracket when door is closed.
4. Complete fastening of hook with 2 remaining screws.
5. With door open, position roller lever in the up position by screwing cylinder into bushing until shaft is about flush with bushing top surface and bottom hole of cylinder lines up with hole in body. Assemble pin through cylinder and body, securing with retainer.
6. After cylinder assembly, push roller lever forward overlapping top edge of the door.
7. Closer is ready to operate- Check function

NOTE: Mounting closer to the latch side of door will give more closing force and less reach. Closing speed set at the factory. Do not attempt to adjust.
